

## a Buffer suitability

## b Deployment role

| Technology          | Layer                        | Role                                                               |
|---------------------|------------------------------|--------------------------------------------------------------------|
| DC-link capacitors  | converter terminal           | absorbs switching and short transients, not the full energy window |
| supercapacitor bank | DC terminal / campus station | high-power, low-energy smoothing                                   |
| lithium-ion BESS    | rack, row, or station        | energy window and longer ramp compliance                           |
| flywheel            | station                      | high-cycle power buffering                                         |
| GPU power smoothing | GPU / server                 | reduces the disturbance before it reaches power delivery           |
